Proposed Communication Matrix between CE Electric UK and BT Openreach

Notes:-

Note 1 – This process is already well established and documented. Telephone numbers are only made available to those people who need to know as part of that process.

Note 2 – Calls are answered by the CRC (Customer Relations Centre) where a fault job is created in TMS (Trouble Management System). In the case of imminent danger to the public a CE Electric UK Rapid response engineer will attend site within 2 hours, make plant safe and initiate any further action required.

Note 3 – Calls answered by the CRC where a fault job is created in TMS. Where there is no imminent danger to the public the job will be passed to overhead maintenance co-ordinators within 5 days of the report to ascertain details of problem and proposed solution. In most cases remedial work will be programmed based on the severity of the problem, and the type of remedy proposed.

Note 4 – Response to be provided back to the DNO within 15 days and a mutually acceptable date agreed for the plant rearrangement work to be carried out.

CE Electric UK

CE Electric UK delivers electricity to more than three and a half million customers throughout the Northeast, Yorkshire and northern Lincolnshire through its subsidiaries, Northern Electric Distribution Ltd (NEDL) and Yorkshire Electricity Distribution plc (YEDL).

Our network comprises 31,000 substations, approximately 29,000 kilometres of overhead lines and 62,000 kilometres of underground cable.

The overhead line network is comprised of lines operating at the following voltages 240/415v, 11kV, 20kV, 33kV, 66kV and 132kV.

Due to the unique nature of the 20kV distribution voltage within parts of NEDL an additional map has been included to help identify those parts of our overhead network that are likely to be operating at 20kV.
